

## DCASE Challenge 2021 Task 4

### Sound Event Detection (and Separation) in Domestic Environments

- Determining the **temporal location** of acoustic events and their category
- Performance measured by **two different PSDS** (Polyphonic Sound Detection Score) scenarios

## Multi-resolution analysis

### Motivation

- Different acoustic events show **different temporal and spectral characteristics**
- Using **multiple time-frequency resolution points** should improve SED performance

### Resolution points

Taking the parameters of the Baseline System (BS) as reference, we define **5 resolution points** for Mel-spectrogram feature extraction, from twice better time resolution ( $T_{++}$ ) to twice better frequency resolution ( $F_{++}$ ).

| Resolution                  | $T_{++}$ | $T_+$ | BS   | $F_+$ | $F_{++}$ |
|-----------------------------|----------|-------|------|-------|----------|
| <b>N</b>                    | 1024     | 2048  | 2048 | 4096  | 4096     |
| <b>L</b>                    | 1024     | 1536  | 2048 | 3072  | 4096     |
| <b>R</b>                    | 128      | 192   | 256  | 384   | 512      |
| <b><math>n_{mel}</math></b> | 64       | 96    | 128  | 192   | 256      |

Table 1. FFT length ( $N$ ), window length ( $L$ ), window hop ( $R$ ) and number of Mel filters ( $n_{mel}$ ) of resolution points.  $N$ ,  $L$ , and  $R$  are reported in samples, using a sample rate  $f_s = 16000$  Hz.

## Model fusion

1. Train a single-resolution SED system for each resolution point (we use the DCASE 2021 Baseline System, available at [https://github.com/DCASE-REPO/DESED\\_task](https://github.com/DCASE-REPO/DESED_task))
2. Ensemble the class-wise score sequences of several resolutions through **average fusion**, obtaining multi-resolution score sequences
3. Process the resulting score sequences (**threshold** and **median filtering**) to obtain PSDS and  $F_1$  results

## Single-resolution results

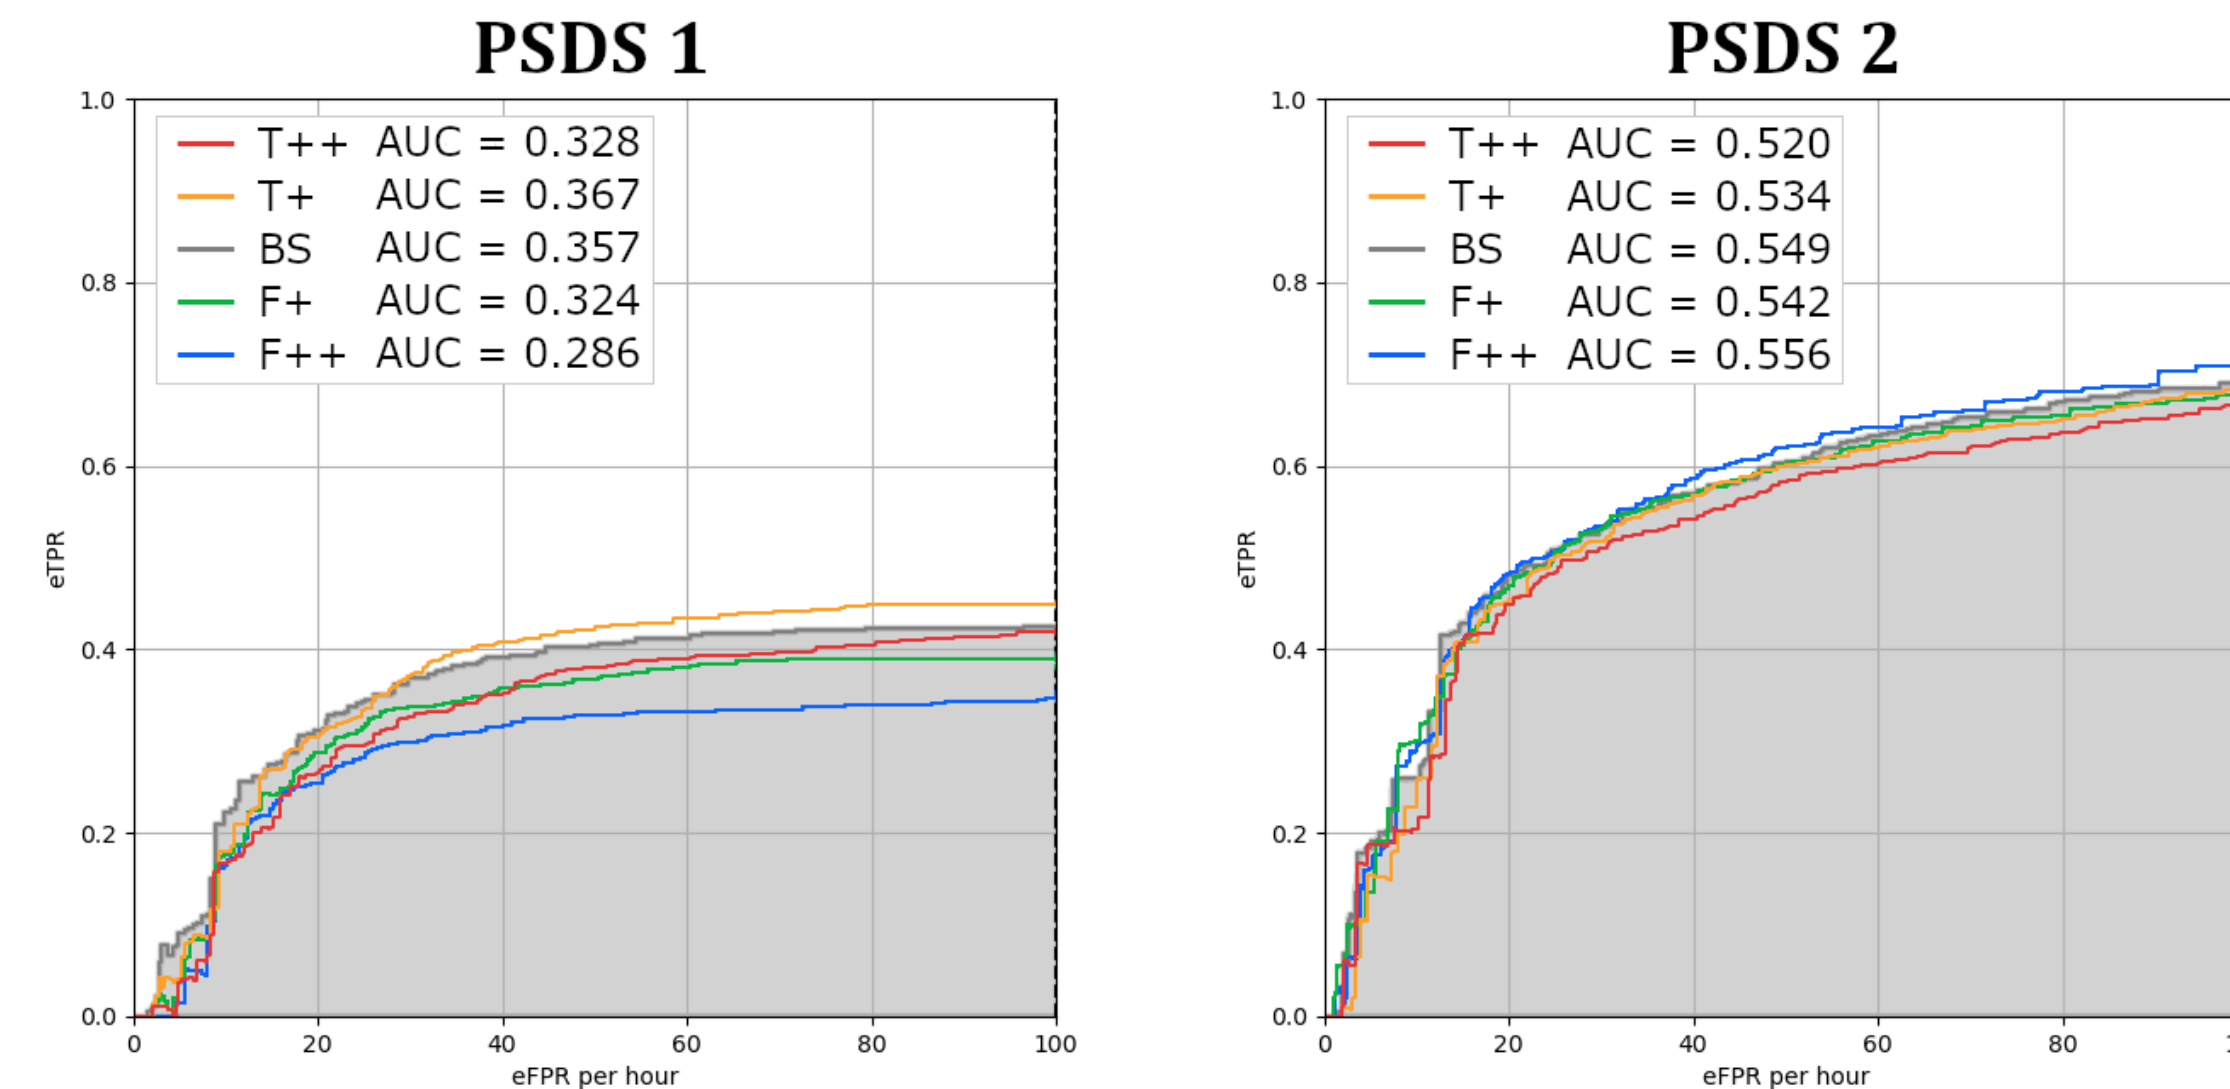

Figure 1. PSDS curves for single-resolution systems in each scenario.

- For **PSDS 1** (focused on precise temporal localization of events),  $T_+$  obtained the best AUC,  $F_{++}$  obtained the worst AUC
- For **PSDS 2** (focused on correct event classification),  $F_{++}$  obtained the best AUC,  $T_{++}$  obtained the worst AUC

Higher time resolution benefits precise temporal detection of events, whereas higher frequency resolution helps correct classification.

## Multi-resolution results

| System                    | Resolutions                             | DESED Validation |              |             | DCASE 2021 Eval |              |             |
|---------------------------|-----------------------------------------|------------------|--------------|-------------|-----------------|--------------|-------------|
|                           |                                         | PSDS 1           | PSDS 2       | $F_1$ (%)   | PSDS 1          | PSDS 2       | $F_1$ (%)   |
| <b>3res</b>               | $F_+$ , BS, $T_+$                       | 0.380            | 0.589        | 45.0        | 0.343           | 0.571        | 42.6        |
| <b>3res-T</b>             | BS, $T_+$ , $T_{++}$                    | <b>0.386</b>     | 0.578        | <b>46.4</b> | <b>0.363</b>    | 0.574        | <b>43.1</b> |
| <b>4res</b>               | $F_{++}$ , $F_+$ , BS, $T_+$            | 0.372            | <b>0.600</b> | 45.1        | 0.345           | 0.571        | 42.2        |
| <b>5res</b>               | $F_{++}$ , $F_+$ , BS, $T_+$ , $T_{++}$ | <b>0.386</b>     | <b>0.600</b> | <b>46.4</b> | 0.361           | <b>0.577</b> | 42.7        |
| <b>Challenge Baseline</b> |                                         | 0.353            | 0.553        | 42.1        | 0.315           | 0.547        | 37.3        |

Table 2. PSDS and  $F_1$  results of multi-resolution systems over the DESED Validation / Evaluation 2021 sets.

Performance in both PSDS scenarios improves when combining different resolutions.

## Class-wise analysis

Table 4. Class-wise PSDS results of multi-resolution systems over the DESED Validation set.

The overall performance pattern (higher time resolution for PSDS 1 and higher frequency resolution for PSDS 2) is not observed for every individual class (e.g: Blender obtains best PSDS 1 with  $F_{++}$ , Running water obtains best PSDS 2 with  $T_{++}$ ).

## Conclusions

- Certain resolutions allow to **optimize either PSDS 1** (precise temporal localization of events) or **PSDS 2** (correct event classification)
- Multi-resolution **improves SED performance** for both PSDS settings, and **outperformed the Baseline System** in the DCASE Challenge 2021 Task 4
- Class-wise analysis shows that **each resolution perform better for different event categories**
